

# Eigenvalues and eigenvectors

- **Eigenvalues and eigenvectors**
- Important matrix properties
  - Hermitian, orthogonality,...
- **Eigenvalue algorithm**
  - **Power iteration**, a simple numerical algorithm producing a number  $\lambda$ , the greatest (in absolute value) eigenvalue of a matrix  $A$ , and the corresponding eigenvector  $v$ , such that  $Av = \lambda v$ .
  - LR algorithm, developed by Heinz Rutishauser (1958 ?)
  - **QR algorithm**

## Applications

- collisional relaxation
- population dynamics, evolution (stationary **population pyramid**)
- normal modes analysis (molecular vibrations)
- PCA (principal component analysis)
- Schrödinger equation in quantum mechanics, molecular orbitals (Hartree–Fock theory)

## Python libraries

- NumPy (more portability)
  - `numpy.linalg`
    - `linalg.eig(a)` Compute the eigenvalues and right eigenvectors of a square array
- SciPy (more complete wrapper on **LAPACK** fortran package)
  - `scipy.linalg`
    - `scipy.linalg.eig` Solve an ordinary or generalized eigenvalue problem of a square matrix
    - **Decompositions** (LU, QR,...)
