

# System of linear equations

Numerical methods used to solve such problem allow to introduce and experiment on [Time\\_complexity](#), considering cubic time behavior of standard algorithms and i.e. quadratic time solutions using LU decomposition.

## Theory

- [System\\_of\\_linear\\_equations](#)
- [Gaussian\\_elimination](#), Gauss and Gauss-Jordan eliminations (diagonalization, triangularization)
- [Pivot\\_element](#), pivoting
- [LU\\_decomposition](#)
  - [Triangular\\_matrix#Forward\\_and\\_back\\_substitution](#)
- Chapter 2 in the book “Numerical Recipes” :
  - 2.0 Introduction
  - 2.1 Gauss-Jordan Elimination
  - 2.2 Gaussian Elimination with Backsubstitution
  - 2.3 LU Decomposition and Its Application
- Python [NumPy](#) library : [NumPy Reference](#)
  - [Linear algebra \(numpy.linalg\) : numpy.linalg.solve](#)
- Time complexity analysis
  - Hint : in Python, use the `timeit` module

## Exercices and applications

- Exercices :
  - write a python function for diagonalisation with partial pivoting
  - random numbers → linear systems
  - comparison with numpy standard library
  - measurements of execution time to check cubic complexity

## 1D problems with neigbours

- Thermal diffusion and chemical diffusion (transient or stationary) on a regular 1D space with equidistant steps. ODE equations can be written such a given evolution equation for node #  $i$  only implies nodes  $i+1$  and  $i-1$
- Using [tridiagonal Thomas algorithm](#) allows to save computational time thanks to  $n$  complexity
- ? Python library with Thomas algorithm
